Study Flashcards

17. What is the formula for calculating precision in a classification problem?

- ☐ Precision = $TP / (TP + FN)$
- ☐ Precision = $TP / (TP + FN)$
- ☐ Precision = $(TP + TN) / (TP + TN + FP + FN)$
- ☐ Precision = $TP / (FP + FN)$

1. Bayes' Theorem is most useful when dealing with which type of probability?

- ☐ Independent events
- ☐ Conditional probability
- ☐ Mutually exclusive events
- ☐ Uniform probability distribution

2. If a hypothesis HHH has a prior probability of 0.3 and new evidence EEE has a likelihood of 0.8 given HHH, how does Bayes' Theorem adjust the probability of HHH after seeing EEE?

- ☐ The probability of HHH increases
- ☐ The probability of HHH decreases
- ☐ The probability of HHH remains unchanged
- ☐ The probability of HHH is completely unknown.

3. In a binary classification problem, what does the True Positive (TP) value represent?
